BACT-A-START

BACT-A-START is a feed disinfectant and gut acidifier for young piglets. BACT-A-START improves the digestive capacity of the immature gut by providing acidity to the stomach and is also an ideal acidifier for liquid feeding.

THE PRODUCT:

BACT-A-START is a blend of organic and inorganic acids formulated to rapidly acidify the stomach and fore gut , but with a carrier technology to carry and release buffered acids throughout the intestine.

When the young piglet is weaned the diet changes from milk to a cereal based ration. In the immature gut of the weaner pig hydrochloric acid is under produced, particularly in early weaned litters. Digestive enzymes also require a low pH to have optimum activity and in the immature gut the result is often poor protein digestion and assimilation as well as a hind gut fermentation, resulting in piglet scours.

BACT-A-START not only supplements the stomach acids but acts as an acidity regulator ensuring the remainder of the digestive tract has a low enough pH to provide optimal conditions for commensal bacteria to flourish, and discourage the growth of enteropathogens.

MAJOR BENEFITS:

- Acidifies the stomach of the young piglet to ensure optimal enzyme activity.
- Lowers the pH of the entire digestive tract, encouraging the growth of commensal bacteria and discouraging growth of enteropathogens.
- Improves performance particularly by helping to prevent post weaning scours.
- By acidifying rations in wet feeding systems it encourages lactic acid bacteria fermentation to stabilise the feed more rapidly and inhibit potential pathogens.

USES:

First stage creep feeds and wet feeding systems 3 kg/Te

Second stage creep/link feeds 2 Kg/Te

PACKAGING:

BACT-A-START is packed in 25kg medium gauge, white plastic bags.
