

MASTERCUBE

MASTERCUBE is a low volume binder for cost effective improvement of pellet quality allowing greater inclusion of oils and fats and reducing fines levels.

THE PRODUCT:

MASTERCUBE combines the binding properties of plant gums with a mineral hardener. All the ingredients are natural products and are fully digestible.

MASTERCUBE does not significantly dilute the nutrient density of the feed.

MASTERCUBE contributes calcium and sulphur to the ration formulation and provide 210 KJ digestible energy per kg inclusion.

MASTERCUBE is a low inclusion pellet binder and is ideally suited to high density rations. It is also invaluable in the smaller pellet sizes (below 6mm) used in poultry feeds and early pig diets.

In rations with low levels of energy MASTERCUBE allows feed compounders to increase the oil content and hence the energy value of the feed without a loss of pellet quality.

MAJOR BENEFITS:

- MASTERCUBE achieves a harder and stronger pellet when the correct temperatures and steam conditions are used. The pellets can be handled in bulk with ease.

MASTERCUBE improves pellet quality resulting in a reduction in fines, and hence waste, and low dust both in the feedmill and during farm deliveries.

- MASTERCUBE permits an increase in fat levels without loss of pellet quality.
- MASTERCUBE is invaluable in high density diets where formulation space is at a premium

USAGE:

1 - 3kg/Te of feed depending on pelletability factors of raw material used.

Note:

No two feed mills are alike with differing ingredients, grist sizes, steam, temperature and operator practices. Individual tests should be undertaken to obtain the best results as pellet binding effects vary from diet to diet, as well as between feed mills.

PACKAGING:

MASTERCUBE is packed in 25kg multi-walled paper sacks.
